New jettable conductive adhesives from Panacol

At Productronica 2015 in Munich, Panacol presents new adhesives with improved conductivity. Jet dispense compatibility and snap cure make these conductive adhesives the ideal choice for high speed production.

Panacol recently expanded its Elecolit[®]-product portfolio. Thanks to new, innovative filling materials and optimized hardener systems, newly developed adhesives with improved conductivity are now available. For maximum processing speed, these adhesives can be applied by jetting. New hardener systems in many of the one part epoxy based adhesives develop cure within minutes.

The new Elecolit[®] silver filled adhesives are available in a range of viscosities to accommodate various applications and requirements. As the conductivity is strongly dependent on the content of conductive filler, Panacol uses uniquely shaped filling materials to achieve an optimal fill ratio. This ensures high conductivity and consistent product performance.

Panacol-Elosol GmbH, a member of Hoenle group, is an international supplier of adhesives with an extensive product range that includes UV curable adhesives, structural adhesives, and conductive adhesives. At Productronica in Munich Panacol presents its high tech products for applications in the field of electronics.
